(Beta) Memory

Community Contributed Project

This project was created with Erik and his daughter Ruth.

If you'd like to contribute a project of your own, then get in touch with us on Github.

Introduction

In this project, you will create a memory game where you have to memorise and repeat a sequence of random colours!

Activity Checklist

Follow these INSTRUCTIONS one by one

Test your Project

Click on the green flag to TEST your code

Save your Project

Make sure to $\ensuremath{\mathsf{SAVE}}$ your work now

Step 1: Random colours

First, let's create a character that can change to a random sequence of colours for the player to memorise.

Activity Checklist

- 1. Start a new project, and delete the cat sprite, so that your project is empty.
- 2. Choose a character and a backdrop. Your character doesn't have to be a person, but it needs to be able to show different colours.

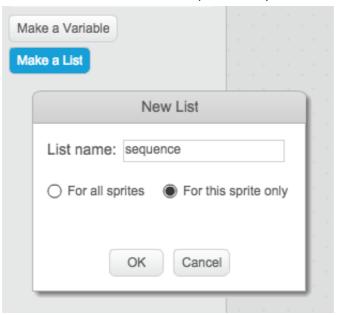

- 3. In your game, you'll use a different number to represent each colour:
 - 1 = red;
 - 2 = blue;
 - 3 = green;
 - 4 = yellow.

Give your character 4 different colour costumes, one for each of the 4 colours above. Make sure that your coloured costumes are in the right order.

4. To create a random sequence, you need to create a list. A list is just a variable that stores lots of data in order. Create a new list called sequence. As only your character needs to see the list, we can also click 'For this sprite only'.

You should now see your empty list in the top-left of your stage, as well as lots of new blocks for using lists.

5. Add this code to your character, to add a random number to your list (and show the correct costume) 5 times:

```
when clicked

delete all of sequence of repeat 5

add pick random 1 to 4 to sequence of se
```

Notice that you have also emptied the list to begin with.

Challenge: Adding sound

Test your project a few times. You may notice that sometimes the same number is chosen twice (or more) in a row, making the sequence harder to memorise. Can you make a drum sound play each time the character changes costume?

Can you make a different drum sound play depending on the random number chosen? This will be very similar to your code to change the character's costume.

Save your project

Step 2: Repeating the sequence

Let's add 4 buttons, for the player to repeat the sequence they've remembered.

Activity Checklist

1. Add 4 sprites to your project, that will become buttons. Edit your 4 sprites, so that there's 1 for each of the 4 colours.

2. When the red drum is clicked, you'll need to broadcast a message to your character, letting them know that the red button has ben clicked:

3. When your character receives this message, they should check whether the number 1 is at the start of the list (that means that red is the next colour in the sequence). If it is, you can remove the number from the list, as it's been guessed correctly. Otherwise it's game over!

```
when I receive red v

if item 1v of sequence v = 1 then

delete 1v of sequence v

else

say Game over! for 1 secs

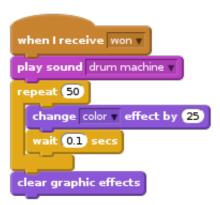

stop all v
```

4. You could also display some flashing lights once the list is empty, as it means the entire sequence has been guessed

correctly. Add this code to the end of your character's when flag clicked script:

```
broadcast won ▼ and wait
```

5. Click on your stage, and add this code to make the backdrop change colour once the player has won.

Challenge: Creating 4 buttons

Repeat the steps above for your blue, green and yellow buttons. Which code will stay the same, and which code will change for each button?

You can also add sounds for when the buttons are pressed.

Remember to test the code you've added! Can you memorise a sequence of 5 colours? Is the sequence different each time?

Step 3: Multiple levels

So far, the player only has to remember 5 colours. Let's improve your game, so that the length of the sequence increases.

1.	Create a new variable called score. Data More Blocks Make a Variable Score	
2.	This score will be used to decide on the length of the sequence the player has to memorise. So, to begin with the score (and the sequence length) is 3. Add this code block to the start of your character's when flag clicked code:	
3.	Instead of always creating a sequence of 5 colours, you now want the score to determine the sequence length. Change your character's repeat loop (for creating the sequence) to:	
4.	If the sequence is guessed correctly, you should add 1 to the score, to increase the length of the sequence.	
5.	Finally, you need to add a forever loop around the code to generate the sequence, so that a new sequence is created for each level. This is how your character's code should look:	

```
when clicked

forever

set score v to 3

delete all v of sequence v

repeat score

add pick random 1 to 4 to sequence v

switch costume to item (ast v of sequence v

wait 1 secs

wait until length of sequence v = 0

broadcast won v and wait

change score v by 1
```

6. Get your friends to test out your game. Remember to hide the sequence list before they play it!

Save your project

Step 4: High score

Let's save the high score, so that you can play against your friends.

Activity Checklist

Add 2 new variables to your project, called high score and name.

2.	If ever the game ends (by pressing the wrong button), you
	need to check whether the player's score is higher than the
	current high score. If it is, you need to save the score as the
	high score, and store the name of the player. Here's how your
	red button should look:

```
when I receive red v

if item 1v of sequence v = 1 then

delete 1v of sequence v
else

say Game over! for 1 secs

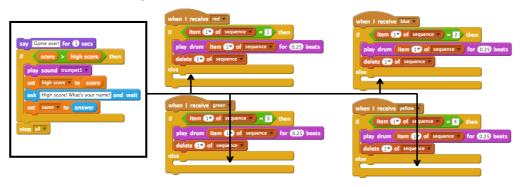

if score > high score then

set high score v to score v

ask High score! What is your name? and wait

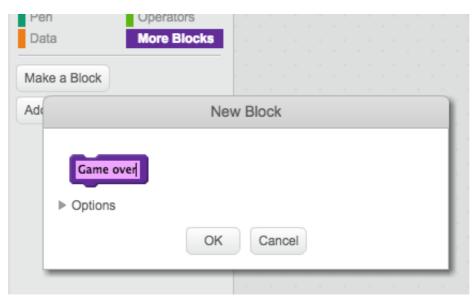

set name v to answer
```

3. You'll need to add this new code to the other 3 buttons too! Have you noticed that the 'Game over' code in each of the 4 buttons is exactly the same?

4. If ever you need to change any of this code, such as adding a sound or changing the 'Game over!' message, you'd have to change it 4 times! That could get annoying, and waste a lot of time.

Instead, you can define your own blocks, and reuse them in your project! To do this, click more blocks, and then 'Make a block'. Call this new block 'Game over'.

5. Add the code from the else block from the red button to the new block that appears:

```
define Game over

say Game over for 1 secs

if score > high score then

play sound trumpet1 

set high score to score

ask High score! What's your name? and wait

set name to answer

stop all v
```

6. You've now made a new function called **Game over**, which you can use anywhere you like. Drag your new **Game over** block onto the 4 scripts for the buttons.

```
when I receive red v

if item 1 of sequence v = 1 then

delete 1 of sequence v play drum 1 for 0.23 beats

else

Game over

say Game over for 1 secs

if score > high score then

set high score v to score

ask High score What's your name? and wait

set name v to answer

when I receive green v
play drum 2 for 0.23 beats

else

Game over

if item 2 of sequence v
play drum 3 of sequence v
play drum 4 of sequence v
play drum 4 for 0.23 beats

else

Game over
```

7. Now add a sound for when the wrong button is pressed. You only need to add this code once in the Game over block that you made, and not 4 separate times!

```
define Game over
play sound cough-female v
say uname v secs
if score > high score then
play sound trumpet1 v
set high score v to score
ask High score Whar's your name? and walt
set name v to answer
stop all v
```

```
when I receive blue v

if Item v of sequence v = 1 then

play drum Item v of sequence v for 0.25 beats

delete v of sequence v else

Game over

when I receive yellow v

if Item v of sequence v for 0.25 beats

delete v of sequence v else

Game over

when I receive yellow v

if Item v of sequence v = 2 then

play drum Item v of sequence v for 0.25 beats

delete v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then

play drum Item v of sequence v = 2 then
```

Challenge: Making more blocks

Do you notice any other code that is the same for all 4 buttons?

```
when I receive red 

if item 1 of sequence 1 then

play drum item 1 of sequence for 0.25 beats

delete 1 of sequence else

Game over

when I receive green 

when I receive green 

when I receive green 

if item 1 of sequence for 0.25 beats

delete 1 of sequence 

for 0.25 beats

delete 1 of sequence 

if item 1 of sequence 

for 0.25 beats

delete 1 of sequence 

for 0.25 beats
```

Can you make another custom block, that is used by each button?

Challenge: Another costume

Have you noticed that your game starts with your character showing one of the 4 colours, and that they always display the last colour in the sequence while the player is repeating the sequence?

Can you add another plain white costume to your character, which is displayed at the start of your game, and when the player is trying to copy the sequence?

Save your project

Challenge: Difficulty level

Can you allow your player to choose between 'easy mode' (using just the red and blue drums) and 'normal mode' (which uses all 4 drums)?

You could even add a 'hard' mode, which makes use of a 5th drum!
